“Ease Traveling ”

Problem Statement:

Currently, passengers often have to visit bus terminals or contact bus operators to check bus schedules, ticket prices, and seat availability. This can be time consuming and may result in long queues, difficulty finding available seats, and inconvenience when managing bookings. Passengers may also have limited information about different buses and their schedules. Manual booking processes can also make it difficult for bus operators to maintain accurate booking records and manage seat availability.

Proposed Solution:

The proposed Online Bus Ticket Booking will provide a centralized web based platform through which passengers can search for buses based on their departure location, destination, and travel date. Users will be able to view available buses, schedules, ticket prices, and seats, select their preferred seat, enter passenger details, and make a booking. The system will generate an electronic ticket after successful booking. Administrators will be able to manage buses, routes, schedules, seats, users, and bookings.

Target Users

Passengers, bus operators, booking staff, and system administrators

Major Features

1. User registration/login
2. Search buses by route and date
3. View bus schedules
4. View ticket prices
5. View available seats
6. Select seat
7. Enter passenger details
8. Book bus ticket

9. Simulated online payment
10. Generate e-ticket
11. View booking history
12. Cancel booking
13. Manage buses and routes
14. Manage schedules and seats
15. Manage bookings

Expected Outcome:

A functional web application that provides an easy and organized method for searching and booking bus tickets while allowing administrators to efficiently manage buses, schedules, seats, and bookings. The project will demonstrate requirements engineering, software design, implementation, testing, version control, CI/CD, and deployment.
